

Env-A 1710, Information Required for General State Permits

Env-A 610 establishes a program for general permits for both state sources and Title V facilities.

Two source categories have been created so far for state sources: 1) internal combustion engines used as emergency generators, and 2) nonmetallic mineral processing plants, also known as rock crushers. Env-A 1710 is a new rule that describes the requirements found in the permit application forms for general state permits. The rule requires only that information that 1) will assure DES that the source in question qualifies for the general permit requested, and 2) is necessary to meet EPA data requirements.

The information required of all general permit registrants is specified in Env-A 1710.02. It requests names and addresses, the applicable source category, and certifications that the source meets the applicability criteria for that source category and that everything in the registration package is accurate and complete. The forms for the two source categories created so far request information that will allow DES inspectors to identify the equipment that will be operated pursuant to the general permit, ascertain that the source meets the criteria to operate under the general permit, and determine which equipment is subject to federal new source performance standards.
